# **Chapter 2 – The Molecules of Cells**

Complete using BC Biology 12, pages 20 - 61

	Basic Chemistrypages 24 - 26
1. 2. 3.	Only 92(a) naturally occurring elements serve as the building blocks of all matter. Other elements have been "human-made(b) and are not biologically important. Only six elements are basic to life and make up about 95%(c) of the body weight of organisms. The elements are <u>carbon</u> (d) <u>hydrogen</u> (e), <u>nitrogen</u> (f), <u>oxygen</u> (g), <u>phosphorus</u> (h), and <u>sulfur</u> (i) which can be remembered with the acronym <u>CHNOPS</u> (i). Of the top six elements, which element is the <b>most</b> prevalent in organisms? <u>oxygen</u> Explain how radiation can be both beneficial and harmful to humans. <u>Radioactive isotopes are used in medical</u> procedures (PET scan). However, high levels can harm cells, damage DNA, and cause cancer
22	Molecules and Compounds pages 26 - 29
	pages 20 - 2)
4.	Where do we get the energy to carry on our daily lives? <u>chemical bond energy (when a chemical reaction</u>
5.	In biological systems, because they are 70-90 (a) % water, jonic (b) compounds
	exist primarily in a dissociated $(c)$ state (they are dissolved $(c)$
6	Molecules made up of only two atoms are always linear (a) while molecules with more than two
0.	which indeed a set of the set of
	atoms have a 3 dimensional (b) shape. The shapes of molecules are related to the
	atoms have a <u>3-dimensional</u> <sup>(b)</sup> shape. The shapes of molecules are related to the
7	atoms have a <u>3-dimensional</u> ( <sup>b)</sup> shape. The shapes of molecules are related to the <u>structural</u> ( <sup>c)</sup> and <u>functional</u> ( <sup>d)</sup> roles they play in organisms.
7.	atoms have a <u>3-dimensional</u> <sup>(b)</sup> shape. The shapes of molecules are related to the <u>structural</u> <sup>(c)</sup> and <u>functional</u> <sup>(d)</sup> roles they play in organisms. Name three molecules that rely on their shape to function properly.
7.	atoms have a <u>3-dimensional</u> <sup>(b)</sup> shape. The shapes of molecules are related to the <u>structural</u> <sup>(c)</sup> and <u>functional</u> <sup>(d)</sup> roles they play in organisms. Name three molecules that rely on their shape to function properly. <u>hormones</u>
7.	atoms have a <u>3-dimensional</u> <sup>(b)</sup> shape. The shapes of molecules are related to the <u>structural</u> <sup>(c)</sup> and <u>functional</u> <sup>(d)</sup> roles they play in organisms. Name three molecules that rely on their shape to function properly. <u>hormones</u> <u>antibodies</u>
7.	atoms have a 3-dimensional       ( <sup>b)</sup> shape. The shapes of molecules are related to the         structural       ( <sup>c)</sup> and functional       ( <sup>d)</sup> roles they play in organisms.         Name three molecules that rely on their shape to function properly.       •       hormones         •       antibodies       •         •       enzymes       •
7.	atoms have a <u>3-dimensional</u> <sup>(b)</sup> shape. The shapes of molecules are related to the <u>structural</u> <sup>(c)</sup> and <u>functional</u> <sup>(d)</sup> roles they play in organisms. Name three molecules that rely on their shape to function properly. <u>hormones</u> <u>antibodies</u> <u>enzymes</u> Give an example of a(n)
7. 8.	atoms have a <u>3-dimensional</u> <sup>(b)</sup> shape. The shapes of molecules are related to the <u>structural</u> <sup>(c)</sup> and <u>functional</u> <sup>(d)</sup> roles they play in organisms. Name three molecules that rely on their shape to function properly. <u>hormones</u> <u>antibodies</u> <u>enzymes</u> Give an example of a(n) <u>non-polar covalent molecule: methane (CH<sub>4</sub>)</u>
7. 8.	atoms have a <u>3-dimensional</u> ( <sup>b)</sup> shape. The shapes of molecules are related to the <u>structural</u> ( <sup>c)</sup> and <u>functional</u> ( <sup>d)</sup> roles they play in organisms. Name three molecules that rely on their shape to function properly. • <u>hormones</u> • <u>antibodies</u> • <u>enzymes</u> Give an example of a(n) • non-polar covalent molecule: <u>methane (CH<sub>t</sub>)</u> • polar covalent molecule: <u>water (H<sub>2</sub>O)</u>
7. 8. 9.	atoms have a <u>3-dimensional</u> ( <sup>b)</sup> shape. The shapes of molecules are related to the         structural       ( <sup>c)</sup> and functional       ( <sup>d)</sup> roles they play in organisms.         Name three molecules that rely on their shape to function properly.       ( <sup>d)</sup> roles they play in organisms.         hormones       ( <sup>a)</sup> antibodies         enzymes       ( <sup>b)</sup> Give an example of a(n)         non-polar covalent molecule: methane (CH <sub>4</sub> )       ( <sup>a)</sup> bond is represented by a dotted line.
7. 8. 9.	atoms have a 3-dimensional       (*) shape. The shapes of molecules are related to the         structural       (c) and functional       (d) roles they play in organisms.         Name three molecules that rely on their shape to function properly.       (d) roles they play in organisms.         •       hormones       (e)         •       antibodies       (f)         •       enzymes       (f)         Give an example of a(n)       (f)       (f)         •       polar covalent molecule: methane (CH4)       (f)         •       polar covalent molecule: Mater (H2O)       (f)         Weaker than an ionic or covalent bond, a hydrogen       (a) bond is represented by a dotted line.         Hydrogen bonding is NOT unique to water. Many biological molecules have polar covalent bonds involving and
<ol> <li>7.</li> <li>8.</li> <li>9.</li> </ol>	atoms have a 3-dimensional       (*) shape. The shapes of molecules are related to the         structural       (*) and functional       (d) roles they play in organisms.         Name three molecules that rely on their shape to function properly.       •       hormones         •       antibodies       •         •       enzymes       •         Give an example of a(n)       •       non-polar covalent molecule: methane (CH4)         •       polar covalent molecule: methane (CH4)       •         •       polar covalent molecule: Mater (H2O)       •         Weaker than an ionic or covalent bond, a hydrogen       (a) bond is represented by a dotted line.         Hydrogen bonding is NOT unique to water. Many biological molecules have polar covalent bonds involving and electropositive       (*) hydrogen and an electronegative
<ol> <li>7.</li> <li>8.</li> <li>9.</li> </ol>	atoms have a 3-dimensional(*) shape. The shapes of molecules are related to the structural(*) shape. The shapes of molecules are related to the structural(*) shape. The shapes of molecules are related to the structural(*) shape. The shapes of molecules are related to the structural(*) shape. The shapes of molecules are related to the structural(*) shape. The shapes of molecules are related to the structural(*) roles they play in organisms. Name three molecules that rely on their shape to function properly.         • hormones      (*) non-polar         • enzymes
<ol> <li>7.</li> <li>8.</li> <li>9.</li> <li>10.</li> </ol>	atoms have a <u>3-dimensional</u> (*) shape. The shapes of molecules are related to the structural         structural       (*) and functional       (d) roles they play in organisms.         Name three molecules that rely on their shape to function properly.       •       hormones         •       antibodies       •         •       enzymes       •         Give an example of a(n)       •       non-polar covalent molecule: methane (CH <sub>4</sub> )         •       polar covalent molecule: methane (CH <sub>4</sub> )       •         •       polar covalent molecule: methane (CH <sub>4</sub> )       •         •       polar covalent molecule: methane (CH <sub>4</sub> )       •         •       polar covalent molecule: methane (CH <sub>4</sub> )       •         •       polar covalent molecule: methane (CH <sub>4</sub> )       •         •       polar covalent molecule: methane (CH <sub>4</sub> )       •         •       polar covalent molecule: methane (CH <sub>4</sub> )       •         •       polar covalent molecule: methane (CH <sub>4</sub> )       •         •       polar covalent molecule: methane (CH <sub>4</sub> )       •         •       polar covalent bond, a hydrogen       (a) bond is represented by a dotted line.         Hydrogen bonding is NOT unique to water. Many biological molecules have polar covalent bonds involving and electropositive       (b) hydrogen and an electronegative       (
<ol> <li>7.</li> <li>8.</li> <li>9.</li> <li>10.</li> </ol>	atoms have a <u>3-dimensional</u> (*) shape. Name three molecules that rely on their shape to function properly.         •         hormones         •       antibodies         •       enzymes         Give an example of a(n)         •       non-polar covalent molecule: methane (CH <sub>a</sub> )         •       polar covalent bond, a hydrogen         •       polar covalent bond, a hydrogen         •       (a) bond is represented by a dotted line.         Hydrogen bonding is NOT unique to water. Many biological molecules have polar covalent bonds involving and electropositive         (b) hydrogen and an electronegative       (c) oxygen or         nitrogen.

#### 2.3 Chemistry of Water

- 11. Use three words or phrases to describe water:
  - <u>polar</u>
  - <u>covalent</u>
  - <u>inorganic</u>

12. Draw a picture showing the polarity of a water molecule and hydrogen bonding between water molecules.

13. Name the

the existence of life. Then explain the importance of

each of the properties as it relates to the survival of an organism.

- a) <u>High heat capacity</u> : <u>allows organisms to maintain their normal</u> <u>internal temperatures and are protected from rapid temperature changes</u>
- b) <u>High heat of vaporization</u> : <u>efficient way to release excess body heat (e.g.</u> <u>sweating or panting)</u>
- c) <u>Solvent</u> : <u>facilitates internal chemical reactions, transports</u> <u>materials in a dissolved state</u>
- d) <u>Cohesion & adhesion</u> : <u>transports through internal vessels</u>, <u>lubrication</u> <u>of joints</u>, <u>transport of water in plants</u>
- e) <u>Surface tension</u> : <u>some organisms are adapted to walking on</u> <u>water</u>
- f) <u>Solid is less dense than liquid</u> : ice floats therefore bodies of water don't freeze solid in winter. Also, insulates bodies of water from sudden temperatures changes

14. Match the terms on the left to their correct description on the right.

- D\_\_\_\_\_\_ calorieA. result of cohesive forcesE\_\_\_\_\_\_ soluteB. molecules that can attract water ("water loving")B\_\_\_\_\_\_ hydrophilicC. property of different molecules or surfaces clinging to each otherG\_\_\_\_\_\_ hydrophobicD. amount of heat energy needed to raise 1g of water by 1°CF\_\_\_\_\_\_ cohesiveE. the dissolved substances contained in a solutionC\_\_\_\_\_\_ adhesiveF. like molecules sticking to each other
- <u>A</u> surface tension G. molecules that cannot attract water ("water fearing")

### Acids and Bases

- 15. Acids are substances that <u>release hydrogen ions (H+)</u> when they dissociate in water.
  - Example:  $\frac{\text{HCl} \rightarrow \text{H}^+ + \text{Cl}^-}{2}$
- 16. Bases are substances that either <u>take up hydrogen ions</u> or <u>release hydroxide ions (OH</u>)
  - Example:  $NaOH \rightarrow Na^+ + OH^-$
- 17. What would the pH be of the following  $[H^+]$  (moles per litre)?
  - $0.1 = 1 \ge 10^{-1} = pH \underline{1}$
  - $0.0001 = 1 \ge 10^{-4} = pH = 4$
  - $0.00000001 = 1 \times 10^{-9} = pH_{9}$
- 18. What is a **buffer**? <u>Keeps the pH within a homeostatic range</u>
- 19. The pH of our blood when we are healthy is always about <u>7.4</u> <sup>(a)</sup>. If the blood pH drops to about <u>7</u> <sup>(b)</sup> then <u>acidosis</u> <sup>(c)</sup> results. If the blood pH rises to about <u>7.8</u> <sup>(d)</sup> then <u>alkalosis</u> <sup>(e)</sup> results. Both conditions can be <u>life threatening</u> <sup>(f)</sup>.
- 20. Show the formula for one of the buffer systems used by the body to keep blood pH in balance.

$$H_2CO_3 \xrightarrow{\text{too basic}} H^+ + HCO_3^-$$
  
too acidic

21. Why is a weakly dissociating acid/base a better buffer than a strongly dissociating one? <u>Allows body to maintain</u> <u>homeostasis without "overcorrecting" and causing pH to swing too far in the opposite dirrection</u>

2.4 Organic Molecules	pages 32 - 33		
22. Organic molecules always contain <u>carbon</u>	and <u>hydrogen</u> . Carbon atom has <u>4</u>		
electrons in its outer shell which it can share <u>covalent</u>	y with as many as <u>4</u> other atoms.		
23. Define the following:			
• functional group: specific combination of bonded atoms that always react in the same way			

- macromolecule: <u>contain many molecules bonded together</u>
- monomer: single organic molecule
- polymer: <u>linked monomers</u>
- 24. Complete the table below.

Polymer	Monomer
carbohydrate	monosaccharide (e.g. glucose)
lipid	glycerol (backbone) + fatty acids (up to 3)
protein	amino acid
nucleic acid	nucleotide

25. Diagram of dehydration synthesis and hydrolysis (wait for simplified teacher diagram)

Maltose

Glucose

Glucose

- 32. Carbohydrates that contain many glucose subunits are referred to as polysaccharides
  - <u>Starch</u> and <u>glycogen</u> are large storage forms of glucose found in plants and animals.
  - <u>Cellulose</u> is found in plant cell walls
  - <u>Chitin</u> is found in the exoskeleton of crustaceans and insects.
- 33. Match the terms on the left to their correct descriptions)on the right.
  - <u>**B**</u> & <u>**C**</u> starch A. indigestible by humans, often referred to as dietary fibre
  - <u>E</u> & <u>F</u> glycogen B. non-branched or slightly branched
  - <u>A</u> & <u>D</u> cellulose
- - C. high amounts found in flour and potatoes
  - D. alternating up/down pattern of oxygen atoms between the glucose molecules
  - E. highly branched
  - F. created by the liver when the blood glucose levels rise above 0.1%
- 34. Identify each of the following as either **starch**, **glycogen**, or **cellulose**.

- 35. The main functions of lipids:
  - Contain more <u>energy</u> per gram (long term)
  - <u>Energy storage</u> molecules
  - <u>Phospholipids</u> form the cell membrane
  - <u>Steroids</u>, includes many types of hormones
  - <u>Insulate</u> against heat loss
  - Forms a <u>protective cushion</u> around major organs
- 36. All lipids <u>DO NOT</u> (a) dissolve in water as they are <u>hydrophobic</u>
- 37. 1 <u>glycerol</u> molecule + 3 <u>fatty acid</u> molecules = <u>triglyceride</u> (neutral fat)

(b)

- 38. What is the difference between...
  - a) fats and oils? Fats: animal origin, solid at room temperature Oils: plant origin, liquid at room temperature
  - b) saturated, unsaturated, and trans fats?
    Saturated: no double bonds, all possible bonds filled with H
    Unsaturated: double bonds between carbon atoms
    Trans fats: produced by hydrogenation, chemical addition of H (man-made, not found in nature)

- 39. In a **phospholipid**, the third fatty acid is replaced by a <u>polar phosphate group</u> ( They differ from fats as they form a polar (<u>hydrophilic</u>)<sup>(b)</sup> head and a nonpolar (<u>hydrophobic</u>)<sup>(c)</sup> tail.
- 40. How are all types of steroids the same? different? <u>All are composed of a backbone of 4 fused carbon rings but</u> differ in the arrangement of atoms in the rings and the type of functional groups attached to them.
- 41. Identify the following steroids.

Cholesterol

# Estrogen

42. Though we often think that cholesterol is "bad" for us in our diet, our bodies require it in a balanced quantity. What important functions does cholesterol serve?Acts as a precursor to many other steroids (e.g. bile salts, estrogen, testosterone)Component of the cell membrane (aids in stability)

2.7 Proteins			pages 37 - 41
43. Central <u>carbon</u>	atom bonded to <u>hydroger</u>	atom and three	functional groups:
• <u>amino group</u>	(-NH <sub>2</sub> )		RO
• <u>carboxylic acid group</u>	ļ	(-COOH)	
• <u>R-group</u>	(differs b	y amino acid, 20 possibilities)	_/ Ц _∕он
44. The main functions of pro	oteins (the table on page 54 is	very helpful)	" H
• Structural: <u>kerati</u>	n (makes h	air and nails) and <u>collagen</u>	(lends
support to ligament	s, tendons, and skin)		
• Movement: <u>actin</u>	& <u>myosin</u>	(movement of cells and musc	le contractions)
• <b>Transport</b> : in the	plasma membrane they act as	<u>channels</u> or <u>carr</u>	iers to
allow substances to	cross. <u>Hemoglobin</u>	(transports oxy	gen in red blood cells)
• Catalytic: <u>enzyme</u>	<u>S</u>	(speed up chemical reactions in	the body)
• Regulatory: <u>horm</u>	iones	(chemical messengers)	
• Defense: antibodie	<u>es</u>	(prevent infections and therefor	re maintain homeostasis)
45. What characteristic influe	ences the structure, or shape,	of a protein? <u>The hydrogen bon</u>	ding between the C=O of
one amino acid and the N	-H of another amino acid		

Testosterone

46. Proteins can have up to four levels of structural organization.

47. Proteins can differ in many ways including <u>length</u> (a), <u>sequence</u> (b), and <u>structure</u> (c) and chemical composition.

- 48. Define **denatured**: protein that has undergone an irreversible change in shape that effects its functioning
  - Possible causes: <u>extremes in heat or pH</u>
  - Prion? causes diseases such as Alzheimer's and Creutzfeldt-Jacob

### 2.8 Nucleic Acids

49. The main functions of nucleic acids:

- <u>Stores genetic information</u>
- <u>Transfers genetic information within the cell & in organism</u>

pages 41 - 45

50. Nucleic acids are made up of <u>nucleotides</u>

\_\_\_\_ which have three subunits:

II O

- phosphate (phosphoric acid)
- pentose sugar (B)
- <u>nitrogenous base</u>
- 51. Write a **(B)** next to the two subunits that make up the backbone of nucleic acids.
- 52. Complete the table.

	DNA	RNA	
Full name	deoxyribose nucleic acid	ribonucleic acid	
Sugar	deoxyribose	ribose	
Bases	Adenine, Thymine, Cytosine, Guanine	Adenine, Uracil, Cytosine, Guanine	
Strands	2	1	
Helix	Yes	No	
Function	Specifies sequence of amino acids for creation of proteins	Makes ribosomes to aid in protein synthesis (mRNA, tRNA, rRNA)	

**(B)** 

- 53. Why are A, T, C, G, and U called "bases"? their presence raises the pH of a solution
- 54. Explain the term **complementary base pairing** and why it is important. <u>Bases only match in specific pairs</u> (e.g. A-T and C-G). This ensures perfect replication and production of proteins.
- 55. Draw two different complementary base pairs. (textbook Figure 2.25c)

56. ATP or <u>adenosine triphosphate</u> is known as the universal energy currency of the

cells of living systems and can be used for the following types of work.

# Example

- <u>Chemical work</u> : <u>synthesizes macromolecules</u>
- Transport work : pump substances across cell membrane •
- Mechanical work
   muscle contraction, moving cilia & flagella

## 57. ATP is composed of

1. d

- <u>nitrogenous base (adenine)</u>
- <u>5 carbon sugar (ribose)</u> •
- <u>3 phosphate groups</u>
- 58. An input of energy is required to create ATP.

Туре

- Where does it come from? <u>breakdown of glucose</u> •
- What is the reaction called? <u>cellular respiration</u> •
- What percentage of the free energy is transformed into ATP? <u>39%</u> •

### 59. Distinguish between an **endergonic** and an **exergonic reaction**. Use a diagram to help if needed.

2. <u>c</u>	12. <u>c</u>	22. <u>b</u>	32. <u>b</u>
3. <u>d</u>	13. <u>c</u>	23. <u>b</u>	33. <u>c</u>
4. <u>d</u>	14. <u>b</u>	24. <u>b</u>	34. <u>a</u>
5. <u>c</u>	15. <u>c</u>	25. <u>d</u>	35. <u>b</u>
6. <u>b</u>	16. <u>b</u>	26. <u>a</u>	36. <u>c</u>
7. <u>c</u>	17. <u>b</u>	27. <u>b</u>	37. <u>a</u>
8. <u>c</u>	18. <u>b</u>	28. <u>a</u>	38. <u>a</u>
9. <u>d</u>	19. <u>b</u>	29. <u>d</u>	39. <u>d</u>
10. <u>d</u>	20. <u>b</u>	30. <u>a</u>	
40. (a) <u>7,6</u>	(b) <u>3</u> (c) <u>2,8,12,13</u>	<u>,14</u> (d) <u>11</u> (e) <u>13</u>	(f) <u>6,7</u>
(g) <u>12</u>	(i) <u>5</u>	(j) <u>10</u> (k) <u>9</u>	(l) <u>3,4</u>
(m) <u>14</u>	(n) <u>1,4,8,10,12,13,14</u> (o) <u>3,4</u>	(p) <u>5</u>	

- 44. <u>Hydrogen bond</u>
- 45. <u>Water is a polar molecule so O<sup>-</sup> of one molecule is attracted to H<sup>+</sup> of another</u>
- 47. <u>Oxygen "holds" onto the electrons more</u>
- 49. <u>Good for quick energy, and can be stored as glycogen for later use</u>
- 50. <u>Because an H<sub>2</sub>O is removed during dehydration synthesis</u>
- 51. Dehydration synthesis
- 52. <u>peptide</u>
- 53. <u>dipeptide (eventually a protein)</u>
- 54. <u>9 (number of bonds)</u>
- 55. <u>disaccharide</u>
- 56. <u>H<sub>2</sub>O</u>\_\_\_\_\_
- 57. <u>hydrolysis</u>
- 59. (a) <u>DNA has the "code" for protein synthesis</u>
  - (c) monosaccharides bond together by dehydration synthesis to form polysaccharides
  - (f) polar molecules "stick" to each other (cohesion)
- 63. They have hydrophilic heads and hydrophobic tails
- 66. (b) <u>liquid</u>\_\_\_\_\_
- 72. <u>Due to 20 different monomers and have 4 levels of structure</u>
- 90. (a) body would start to use fat stores to get enough energy
  - (b) <u>lipids</u>
- 91. Body wouldn't have monomers to build proteins required by the body for regular functioning (e.g. enzymes, hormones, etc) which could result in body systems shutting down.
- 93.

Carbohydrates	Lipids	Proteins	Nucleic Acids	High Energy Compounds
polysaccharides	triglycerides	peptides	DNA & RNA	ATP
disaccharides	fatty acids	amino acids	nucleotides	nucleotide
monosaccharides	glycerol			phosphate group

You must now MARK the review questions using the answer key on pages 524 - 526!
